

UTX (KAFO)

The **UTX-SWING** keeps the knee locked during stance and stance phase during gait. Free knee flexion is possible during the swing phase of walking. This makes walking with the UTX-SWING safe and with a naturally gait.

UTX-STABIL The knee joint has a lock that can be unlocked while sitting. During walking the knee joint ensures support in both flexion and extension and the knee remains locked.

With the **UTX-FREE** the knee moves freely in the sagittal plane in flexion. Suitable for stabilisation or Knee hyperextension of in combination with a FS versie (see below) stabilization in the frontal plane knee.

The **UTX-POST** supports the knee in the sagittal plane in cases of hyperextension. The UTX-POST prevents increase of the hyperextension and stabilises the knee by means of the posteriorly placed pelottes.

Additional UTX functionalities:

The **FS-Module** also supports the knee in the coronal plane in cases of valgus or varus instability by means of a smart cable construction. The UTX-FS offers optimal stability during gait, corrects the valgus of varus and reduces pain in the knee. The FS-Module can be combined with all UTX variants.

The AFO (Ankle Foot Orthosis) can be ordered at Ambroise. The AFO is based on a innovative photo measurement technique, so casting the leg is no longer needed. The AFO can be applied to a UTX and UTX-ESF. When the Swing functionality should be maintained you can order a **UTX-ESC** (AFO Swing Combination)
